Home electricity use in US falling to 2001 levels

WASHINGTON — The amount of electricity used in U.S. homes is falling to levels not seen since 2001, according to a report from the U.S. Energy Information Administration. The report says that residential electricity consumption in the United States fell 1.5 percent in 2012 from 2011, and is now down 1.5 percent from 2001 levels. The report also says that the decline in electricity use is due to a combination of factors, including the use of energy-efficient appliances and the growing use of energy-efficient buildings.

BETTER GADGETS
The report also notes that the decline in electricity use is due to a combination of factors, including the use of energy-efficient appliances and the growing use of energy-efficient buildings.

BETTER HOPES
The report also notes that the decline in electricity use is due to a combination of factors, including the use of energy-efficient appliances and the growing use of energy-efficient buildings.

ON THE OTHER HAND...
The report also notes that the decline in electricity use is due to a combination of factors, including the use of energy-efficient appliances and the growing use of energy-efficient buildings.
